

# First African Penguin Artificial Nest Deployment - Dyer Island

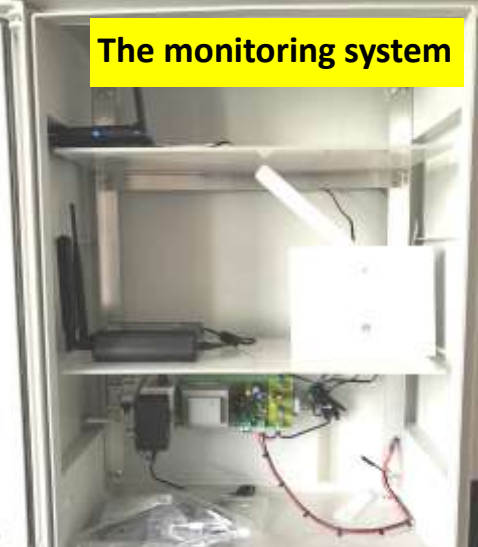

The new Eco friendly

The Old/existing

Sensor

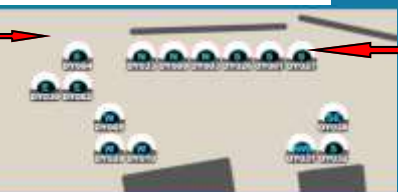

The monitoring system

A percentage of the nests are monitored along with the environmental conditions. This is to accumulate *in-situ* data to compare with the static tests done over the last year. You can follow it via the PAAZA mobile app as shown below.

Selecting a nest (or hovering over it with a mouse), will display the temperature and humidity inside the nest. These are the two main parameters for successful habitat of a nest.

Thank You to the development partners:
